Bradman 1.0 out of 5 stars I dont know if they would have been OK if I had been using a decent charger or not, but this charger damaged them badly, from over heating, over charging enough that when I did get into quality chargers, these free batteries couldnt be saved, and had to be recycled. I suspect that the batteries were like the charger, not very good and with a higher mAh number than they deserved. The initial impression was they were holding a charge and doing the job. I read some really horrible reviews about the charger so I used a couple of known working units. I charged and discharged the batteries 3 times like you should to condition the batteries and was quite pleased by the performance. Im a professional freelance photographer and shoot sports. The batteries held up right after a charge but if they are charged and sit for more than a day or so, they start to discharge. After about 3 days, I got about a 75% capacity out of them. Bottom line is that they are inexpensive but should hold up for most applications. BUT. charge them as close to use as possible. Of course, continually overcharging NiMH cells will shorten their operational life span unlike LiIon or NiCad. I also have to note that the cells are too wide.

I tried to put them in my XBOX 360 controller, and they would barely even fit. I had to push so hard to get them in that the plastic coating is scratched. Ive never experienced this problem with batteries before. I measured the diameter of a Duracell AA cell at 14.0mm, while the diameter of these cells is 14.3mm. Between the oversized batteries, the outrageous charging time, and a charger that doesnt indicate completion, dont buy these. They suck. When charging 4 AA batteries with the CH1800, the left LED goes out the right stays on when fully charged. Final charge was 1.38 volts. When charging 4 AA batteries the Sanyo, the single LED goes out when fully charged. The final charge was 1.41 volts. The CH1800 charger and batteries are designed for digital cameras. They fit easily into my Cannon PowerShot A75. Who knows where you will be in 20 hours. Perhaps over night is Alaska. This too bad because amazon is a great company. All battery's must be loaded from the front. The battery's themselves are somewhat OK and for what Amazon is selling this for its ok to buy it just for the battery's and throw the charger away. Please also note that the battery's seem a bit wider then normal and you may have a problem with some devices. I guess I would have to say. stay away. Less than seven bucks for four batteries and a charger is a joke. The charger runs a tad hot and does not warn when fully charged but if you charge overnight and unplug in the AM they seem to hold their charge well. Good deal, we bought 4. DO you have the exact model number Be certain your radio is always turned off, when charging an attached battery. The NiMH battery will generally go 1216 hours on a charge when new. If you work an eight hour shift, you might see if the radio will go 2 days on a charge. Later as the battery ages, you will need to charge it nightly. Think of putting it in the charger as putting it to bed at night. Rapid charging is necessary on NiMH and LiIon batteries. It will not harm this chemistry of battery. It is safe to leave the battery on the charger overnight, or for a weekend. We would not recommend leaving the battery on the charger longer periods of time, as that will age the battery and reduce its life. Sidenote Frequent rapid charging will however reduce the life of a NiCD battery. Otherwise, contact support Sakar Digital Concepts. Sakar Digital Concepts. Take time to practice controlling the altitude and getting accustomed to the throttle sensitivity. Trimming Once flying at the desired height the helicopter may be spinning under the rotors instead of holding a heading. Adjust the trim control so that the helicopter body does not spin Turn the trim control left if the body is spinning right Note many factors affect the trim of the helicopter such as battery condition, throttle setting and damage to the rotors. It may Once trimmed, minor corrections can be managed using The helicopter should never be flown with damaged rotor blades. Flying the helicopter with damaged rotor blades is very hazardous. See "TROUBLESHOOTING" and "REPLACING DAMAGED ROTOR BLADES" sections for more information.

Forget, and you'll overcharge the batteries; take the charger off too soon and you won't charge them. That's easy to understand if you remember that charging a battery essentially involves. In a laptop battery, it can take as long to charge the last 25 percent of a battery orange area as the first 75 percent yellow area. It's worth remembering this if you. If batteries are fully charged and you. They do that by heating up and building. Right A digital display. Many thousands of these chargers were sold, but there were NiMH batteries can be fast charged on. Some people swear the. The real

explanation for an apparent memory effect is Battery experts insist you can cure this problem by charging and discharging. By the same token, bigger rechargeable batteries need charging for longer. The more energy you expect to get out of a rechargeable battery. A basic law: How long is that? It can be very confusing, especially if you use batteries that didn't come supplied with your charger. Never fear! All you have to do is read what it says on your batteries and you should find often in tiny writing the recommended charging current and charge times. If you have a basic charger, simply check its current rating and adjust the charge time accordingly. Bear in mind what we've said elsewhere about matching your charger to your batteries, however. So the amount of charge you're supplying and the amount the battery will absorb are in the same ballpark. Again, the battery itself claims its capacity is lower than this 1000mAh.

The battery is rated slightly lower 970mAh. Typically they. Lithium-ion batteries can become dangerously unstable when their voltage gets. Read more about how lithium ion batteries work. When the battery needs charging, the camera warns you well in advance. Simply remove the battery very easy on a digital camera, put it in the separate charger unit, and the indicator light shows red, turning green when the battery is fully charged. The whole process is automatic and safe: the camera stops you using the battery before its voltage gets too low; the charger stops you charging it before the voltage gets too high. They're most. Generally they last for several years, though that depends entirely on how well they do. They do take quite a long time to charge typically up to 16 hours—several times longer than they take to fully discharge, and that can lead to a tendency both to undercharge. Undercharging, charging with the wrong voltage, or leaving batteries unused causes a problem known as sulfation: the formation of hard lead sulfate crystals, while overcharging causes corrosion: permanent degradation of the positive lead plate through oxidation, analogous to rusting in iron and steel. Both will affect the performance and life of a lead-acid battery. Overcharging also tends to degrade the electrolyte, decomposing water by electrolysis into hydrogen and oxygen, which are given off as gases and therefore lost to the battery. That makes the acid stronger and more likely to attack the plates, which will reduce the battery's performance. It also means there's less electrolyte available to interact with the plates, also reducing the performance. From time to time, batteries like this have to be topped up with distilled water not ordinary water to keep the acid at the optimum strength and at a high enough level to cover the plates. The first rule of NiMH batteries with a nicad charger.

Many modern rechargeable. Note the voltage and current that. Here are some top tips I've found. Don't leave them sitting. For example, use a NiMH charger for NiMH batteries. You will damage them. They will warm up during charging, but if they get really hot, something's wrong. Your batteries will last much. For example, the. If you don't do this, you can't always tell which are rechargeable.
