Update my browser now By Jim Stanley These venerable workhorses have "been there and done that" in the pro audio world for decades, and have pretty much been the portable "mixer of choice" for those of us in radio and television broadcasting. Product Points Applications Field, broadcast Weight is just a touch over 5 pounds, with eight AA batteries installed in the internal battery pack. Radio broadcasters, electronic cinematographers and other field users will want to have a look at this mixer, too; the feature set on the DMXP01 is perfect for many of their applications as well. Audio processing is 24bit, with sampling rates switch selectable between 48 kHz and 96 kHz. Inputs and output connections are made via professional grade XLR connectors, with each of the mic inputs capable of providing phantom power to microphones that require it. In my tests, the battery pack lasted more than four hours, and Sony provides two battery holders with the unit, so extended operation with batteries is definitely a viable option. One of the more interesting ones is the "Cascade" option; Sony has provided a means of linking together multiple mixers via a digital interconnect, for field mixing applications that require more than four inputs. The level meter can be configured to display standard VU, dBf or one of several PPM weightings. Utilizing a four position Function switch and a volume control style digital encoder knob, the DMXP01 gives users extensive control of almost every mixer parameter.

The menus allow users to store and recall mixer setups via internally stored scene files, monitor camera return output when the mixer is connected to a camcorder, adjust lowcut filter settings, switch on the builtin limiters and output compressor, select the type of meter for audio monitoring and more. This is one tough unit that will easily be able to stand up to the rigors of news and field production use. On the front panel, input gain controls are located just below the main level knobs. Accessing Menu 4 from the Setup display, users can adjust low frequency cutoff between 50 and 400 Hz. There are both "A" and "B" settings available on the front panel LCF switches, so two different filters can be configured simultaneously to meet individual miking needs. Filter rolloff is fixed at 12 dB per octave. The output compressor is completely configurable, and allows adjustment of threshold, ratio, attack and release. Users can select from six different settings. Default setting for the mixer is dB FS; PPM1 provides BB type weighting, while PPM 2 yields DIN style metering. Conventional VU ballistics are available as well. Sony provides six different scale templates with the

mixer. Two screws over the LCD display hold the scales in place; once again Sony gets high marks for using mounting screws that are captured, so they cannot be lost. Changing scales is super easy; the plastic templates just drop in. Master output levels are adjusted with two small potentiometers, located just below the LCD display. Peak reading LEDs are mounted above each of the controls. Turning the multifunction control one click to the right highlighted the Reset command in the LCD display. A push of the knob, and the meter was reset. The Sony manual says that users should get approximately five hours of operation off of the internal battery; my experiences with battery operation were close to that figure.

The podium mic was fed to Input 1 on the mixer, a reporter's wireless mic attached to Input 2, and a third omnidirectional microphone connected to Input 4 for nat ambient sound. In this case, I used the discreet L and R stereo outputs of the mixer to feed the photog's camcorder. Sony provides a special multipin connector with the DMX mixer that allows the user to make up a custom audio cable for interconnecting a professional camcorder to the mixer, but I did not use this during my testing. The press conference went off without a hitch. Recorded audio was crisp and clear, and the ability to mix wild sound with the podium and reporter mics added a sense of "presence" to the recorded piece. This booth is manned each morning by two professional translators, who interpret a television morning news broadcast in Spanish for realtime insertion on the station's SAP Secondary Audio Program channel. The AES output of the mixer was then connected directly into the station's digital router. This was actually appreciated by the announcers, as it gave them one less thing to worry about while doing their translating. Input limiting was enabled on each of the two microphone inputs, along with a modest amount of output compression and limiting. After the morning's newscast, both translators reported a perceived improvement in the overall quality of their audio, compared with the old mixer. The only issue the announcers mentioned was the difficulty in viewing the LCD display off axis; even when viewed straight on and backlit, the display is less than sharp. Rugged and featurepacked, this mixer is sure to become a favorite with the EFP and ENG crowds, and will probably become the new "mixer of choice" anywhere high quality and portability are required. If you have made the jump to digital recording, be sure to give the Sony DMXP01 a try. You will find the current user manual for Sony field mixers in the details of individual products.
