

I'm not robot!

trick the system. Your app can still be successful even if it's not in a top category. Those categories are more competition. Depending on your strategy, you could target a niche category that's less saturated and try to dominate a larger share of a smaller market. Apple Store availability As I just said, the mobile app industry is highly competitive. But how many apps are going to be competing with? Take a look at the number of apps available on the Apple App Store. The number of available apps is continuing to rise each year. Based on all of the statistics we've analyzed so far, this makes sense. More people have mobile devices than ever before, and app downloads are at an all-time high. So it's only natural that more apps are being sent to market. But are app download numbers on the rise because more apps are available? Or are more apps available because so many more apps have been released? It's tough to say, and you can argue both sides. We'll have a better understanding of this reasoning after we analyze the Google Play Store. Google Play Store Download Statistics Now it's time to look at the download statistics from Android devices. I took the time to create a more in-depth analysis of the Google Play Store. Google Play store availability We just finished looking at the Apple App Store availability. So I wanted to jump right in and show you the number of apps available for download on the Google Play Store. As you can see, the graph doesn't have the same trajectory as the Apple graph for this same category. We're actually seeing a drop in app availability after mid 2017. Why is this happening? The Google Play Store is highly competitive. Some apps just weren't able to survive. However, I don't expect to see this trend continue in a downward direction. It should stay level and eventually rise again in the coming years. As we already saw, Google Play Store downloads are still rising, even though the number of apps available for download has dropped a bit. Let's tie this back into our Apple discussion. The Apple App Store app availability numbers are rising each year, but the download growth rate is a lower percentage compared to the Google Play Store. Based on this information, I think it's safe to conclude that the number of apps available on each store isn't linked to rising app downloads overall. Most popular Google Play store app categories You can measure the success of an app category based on penetration. According to Statista, these are the app categories with the highest penetration rate among Android users. Tools — 99%Communication — 99%Video players and editing — 96%Travel and local — 95%Social media — 95%Productivity — 92%Music — 88%Entertainment — 84%News — 81%Photography — 75%Books — 70%Lifestyle — 65%Personalization — 60%Business — 39%Shopping — 35%Weather — 32%Sports — 30%Education — 28%Finance — 25%Health — 23% Some of these categories need to be taken with a grain of salt. For example, look at the top three categories on the list. Those apps likely come pre-loaded on all Android devices. But aside from that, this list is a good indication of what types of apps Android users have downloaded. However, just because an app has been installed on a device, it doesn't mean that it's being used. We'll discuss this concept in greater depth as we look at mobile app usage statistics. Mobile App Usage Now that you've seen how users across the world download apps, it's time to analyze how people are using mobile apps. The average smartphone user spends 2 hours and 15 minutes each day using apps. Research shows that there are between 60 and 90 apps installed on the average smartphone. But with that said, people aren't using all of those apps. Here's a deeper look at how many apps people really use. The majority of mobile time is spent using three apps. Even though the average person uses 25 apps per month, 96% of that time is split between just ten apps. If the average person has 60-90 apps on their phone, this means that more than two-thirds of those apps don't get used every month. What does this mean? It's simple. People are downloading apps and not using them. In fact, 75% of apps are used once after being downloaded, and then never used again. We'll dive deeper into app usage statistics as we continue through this guide. Mobile app retention and churn As you just learned, app usage is not guaranteed after a download. Some of you might be aware of this if your app has already been brought to market. You may have had some initial downloads, but you're struggling to make money because people just aren't using the app. It's a common problem that I see when I'm consulting with app owners. But how do you know if this is happening to you? The best way to measure this is with retention and churn. 71% of app users churn within the first 90 days of downloading an app. What does this mean for you and your app? Basically, you need to track these metrics. Give users a reason to keep coming back and using your app down the road. You'll never have 100% retention, so you always need to be coming up with ways to get new downloads. But with that said, it doesn't mean you should be ignoring existing users. If your app doesn't perform well and has glitches, bugs, or UX flaws, people will be more likely to churn. No app is perfect. Even the top apps have bugs now and then. But it's your responsibility to identify those errors. Come up with updates and new versions of your app to improve the performance and user experience. Most essential apps Earlier we talked about app popularity in terms of what's available for download, as well as penetration by category. But just because they are available, it doesn't mean they are being used. In fact, just because they are being downloaded, it doesn't mean that they are being used either. We already saw the data to back that claim. Now I want to show you the apps that users say they can't live without. If you look at this list, it makes sense. All of the top apps are used for different purposes and could be used on a daily basis. Amazon for purchasesGmail for email communicationFacebook for social mediaYouTube for video contentMaps for navigation For those of you who want to develop a new mobile app, I can't say I recommend building something that competes with one of these top apps. There is nothing wrong with shooting for the stars. You can still build a mobile commerce app for your business and have plenty of success. But it would be an uphill battle, to say the least, if you wanted your app to be the next Amazon. Can you build an app with GPS map services? Sure. But will it surpass Google Maps? Probably not. Apple and Android global spending As we've seen, there are clearly some download and usage differences between Apple and Android devices. Why? Well, the users aren't the same. If you compare Apple and Android users, you'll learn that they behave differently. For starters, let's look at the way people spend money using their devices. In 2017, 85% of global smartphone sales were for Android devices. Apple accounted for just 14% of those sales. However, even with a smaller market share, Apple users still spend more money. While your app should be appealing to all users, you'll have better luck getting iOS users to buy premium upgrades and other in-app purchases. Mobile app usage by age Technology usage varies by generation. Mobile app usage is no exception. You probably assumed that younger generations spend more time using mobile apps than people who are older. If so, that assumption was correct. However, that doesn't mean you can't target other age groups. As you can see from the graph, people between the ages of 45-54 spend two hours per day using mobile apps. That's just 36 minutes less than people in the 25-34 age range. Even users over the age of 65 spend 1 hour and 36 minutes using mobile apps every day. Mobile App Usage by Device Not all mobile usage is created equally. In addition to the differences between operating systems, the usage will also vary by the type of mobile device that people use. Smartphone app usage Digital content can be consumed from so many devices. People have smartphones, tablets, desktop computers, and laptops. You can even access content and apps from smart TVs, watches, smart home devices, and smart vehicles. But there are certain categories that are dominated with smartphone app usage. These are the top categories that people turn to their smartphones for. In the United States, 96% of digital time using maps came from smartphones. 86% of digital weather content was consumed through smartphone apps. Logically, it makes sense. People need to access maps and GPS services on the go, so a smartphone is obviously the best choice. But if you look farther down this list, you'll see other categories that aren't as obvious. For example, 47% of retail consumption comes from smartphone apps. People have so many ways to buy online, yet they still choose to use smartphones at a high rate. News and information is another category that jumps out at me. While the smartphone usage is just over 40%, it's still high considering all of the other platforms and outlets at our disposal. Smartphones vs. tablets Smartphones and tablets have some differences as well. If you recall from earlier, there are twice the number of smartphones worldwide than tablets (2.7 billion vs. 1.35 billion). But tablet usage is starting to catch up with smartphones. People download more apps on their smartphones and use more smartphone apps on a monthly basis. But as you can see from the visual, tablets aren't too far behind. Considering the fact that smartphones are seemingly always within an arm's reach, it makes sense that they would be used more. However, tablets outperform smartphones by a hair when it comes to paid apps or subscription purchases via an app. This could be a category that tablets will continue to control in years to come. Tablet usage While tablets may not be as popular as smartphones, they are used for specific purposes. Here's a look at the most popular app categories used on tablets. Here's another instance where gaming ranks first on a usage list. If you compare this graph to the previous one, you could conclude that a user is more likely to pay for gaming apps that are installed on a tablet. Since tablet screens are larger, the gameplay and user experience will be enhanced. That's probably why tablet users are willing to pay more for downloads and subscriptions. Mobile App Usage by Country Like nearly everything else, behavior changes by location. This same concept can be applied to app usage. We'll take a look and analyze how people in different parts of the world use mobile apps. You can use this information to learn about the audience you're targeting, or potentially see an opportunity in new markets. Number of apps used Here's a look at the number of apps used each month in different countries. Japan and China have the highest average number of apps installed on smartphones. However, the percentage of apps being used isn't nearly as high. Then look at how that compares to a country like India. They have the second lowest number of apps installed per device, but the highest number of apps used per month. So the usage rate is much higher there. So if a person in India downloads your app, there is a greater chance that they'll use it, at least on a monthly basis. Daily app usage Now let's see how many apps people are using each day. It's fairly even across the board for these ten countries. All of them are right above or around the ten app per day mark. Average minutes per day While the number of apps being used isn't too different from country to country, the amount of usage time varies quite a bit. Since Android dominates the global market share, it makes sense to use this platform for comparison purposes. These are the average minutes per day that Android users in different countries spend using apps. Compare this data with the previous graph. South Korea ranked second to last in terms of the number of apps being used per day. They are just one of two countries that use less than 10 apps each day, on average. However, they ranked first in the number of minutes per day spent on apps. There is one thing that remains consistent across the board for each of these countries. The time spent on mobile apps is growing each year. Conclusion Mobile apps are part of our daily lives. 2019 will continue to be a big year for the mobile app industry. Even though mobile usage and penetration are at an all-time high, every piece of data that we analyzed shows we are still trending upward.This is encouraging for anyone who has a mobile app or plans to build one. But you can't just develop and manage an app without staying up to date on the latest research and trends. So use this guide as a reference to help you understand the mobile app industry from a download and usage perspective. Source: BuildFire Android Apps Business Information IOS Mobile Stats

16.5.2022 · 26. The Android device market share in Latin America comes in first in the mobile (89.47%) and tablet (59.23%) markets but second when it comes to all devices, behind Windows. 27. Latin America has a fairly small iOS market share - 3.75% overall, 9.83% on the mobile market, and 40.56% when it comes to tablets. 21.3.2022 · That will allow using Xamarin.Android 12.0 in VS 2019.
