It breaks down consumption into tranches and costs per kWh. The calculator has 6 simAI-enhanced title and description 01-20-2025,09:20 AM #1 Hi all, Please help me with a formula to calculate electricity bill which is based on variable rate from its slab rate mentioned in the sheet. I need the formula in cell G5, where the first 100 units price is always 0 and should calculate remaining units based on the slab. i.e., from 101-200 units it should take 2.35rate, from 201-400 units, the rate is 4.7 and so on. I am clueless on this. Have attached the sheet. Please help. Thank you! Attached Files Electricity Bill Calc - Variable Rate.xlsx (13.3 KB, 15 views) Download 01-20-2025,10:13 AM #2 01-20-2025,10:48 AM #3 Thanks. But I am getting 5060 as answer in G5, however my Electricity Company calculated as below and gave the bill for 5295. 0 - 100 Units0 101 - 400 Units1350 401 - 500 Units600 501 - 600 Units800 601 - 800 Units1800 801 - 850 Units525 Total5295 I don't know how to get the prices? for examples as follows 101 - 400 Units1350 401 - 500 Units600 01-20-2025,11:10 PM #5 I'm with windknife. How do you get your calculation? The way I see it, the price is: 100 at 0 = 0 100 at 2.35= \$235 200 at 4.70=\$940 100 at 6.3=\$630 100 at 8.4=\$840 200 at 9.45=\$1890 50 at 10.50=\$525 Total = 5060 01-21-2025,01:08 AM #6 Apologies, I made a mistake in the slab rate. I have corrected and reworked my sheet. Works perfectly. Thank you windknife & Gregb11. 01-21-2025,02:41 AM #7 You are welcome. 01-22-2025,08:40 AM #8 Administrative Note: We would very much like to help you with your query, however it has been brought to our attention that the same query has been posted on one or more other forums and you have not told us about this. You are required to do so. Cross-posts are allowed but you must provide a link to your posts on other sites. For new members: you will not be able to post a full URL, so remove the . section and add one or two breaks to the rest of the address. A Moderator or Admin will then fix the link for you. Please see Forum Rule #7 about cross-posting and adjust accordingly. Read this to understand why we (and other sites like us) consider this to be important: (Note: this requirement is not optional. No help to be offered until you provide a link or, for members with fewer than 10 posts, a comment telling us where else you have posted this query.) Ali Enthusiastic self-taught user of MS Excel who's always learning! Don't forget to say "thank you" in your thread to anyone who has offered you help. It's a universal courtesy. You can reward them by clicking on * Add Reputation below their user name on the left, if you wish. NB: as a Moderator, I never accept friendship requests. Forum Rules (updated August 2023): please read them here. 01-22-2025,09:33 AM #9 Yes, I didn't mention because the second query which is posted in excelguru is slightly different from the one posted here except for the title. The second query uses two slab rates. that's why I posted it there instead of asking it again here as it may appear awkward. Thanks. The dataset shown below contains the current meter reading, the past meter reading, and the consumed units of electricity of ten different households located inside a building. The cells on the right overview the final output you are going to get. Consider the following dataset Monthly electricity usage of Johnson H. housing society (Building 1). Method 1 Electricity Bill Calculation for Fixed Unit PriceSteps:Add the Unit Price and Total Bill columns (G and H) to the right.Fill in the column G with desired values.Go to cell H5 and type the following formula:Press ENTER to get the result.Place the cursor at the bottom right corner of cell H5, left-click on it and drag the cursor down to cell H14. Method 2 Electricity Bill Formula for Variable Unit Price (Slab)Consider a table such as the one below, showing progressive prices in the electricity usage slabs.Steps:Make the column G as Total Bill.Select cell G5 and insert the following formula and press ENTER to get the expected result: =IF(F5
