Is it that the Internet is getting slower or we are the ones getting impatient? A lot of people these days complain about slow loading websites, Internet pages, slow download etc., but most times it is blamed on the individual's Internet network. While this might be true sometimes, it is entirely your internet provider's fault. The another explanation for this issue, so you should stop blaming your Internet provider now. According to CNN, the reason behind the constantly reducing Internet speed has to do with the significant increase of websites on the Internet featuring webpages with heavy-sized images, videos, embedded content, codes and other things. This heavy contents is said to be the major contributor to slower Internet loading times. - Scroll down to continue reading article - - Scroll down to continue reading article - According to Digital Trends, the average site now has a size of up to 2.1MB—a whopping 100% increase from the size of websites just three years ago. No wonder it takes longer for us to get results on the Internet! Of course, new technology is matching this phenomenon megabyte for megabyte, making it possible for us to download files faster with VPN Download software and connecting to the Internet through 4G, wireless networks. - Scroll down to continue reading article - - Scroll down to continue reading article - The following are three of the reasons some websites on the Internet are slow: 1. Unoptimized Images Large megabytes of unoptimized images are one of the main culprits of a slow Internet. While full-sized images look cool, they consume a lot of bandwidth causing the site to slow down. We should all do our part in making the Internet faster by taking our time to resize images that we upload on our websites and blogs. You should edit the image by finding the feature that allows you to edit its height and width. Be sure to proportionally scale the image so it doesn't look stretched. 2. Too Much Flashy Ads Another reason some websites are slow are the flashing ads, as they slow down the speed, making for bad user experience. Fancy or flashy isn't always fun when you are trying to increase speed. To make your browsing experience smoother and less distracting, you can download an ad blocker on your phone and computer to stop unnecessary ads. This will make your Internet improve. - Scroll down to continue reading article - - Scroll down to continue reading article - 3. External Embedded Media Another major issue that is clogging up websites and generally slowing down the Internet is external media usage. Embedding videos and slideshows on sites slows down the loading speed of the site. It is better to host all content on your own server or better still—try not to embed other people's videos and content on your site. There are other reasons why the Internet is slow besides websites such as browser type, network congestion, and the number of other tabs you have open. However, if you are a blogger or you run a website or business page, it would be better if you cleaned up your website and upped your speed. Don't take any chances because the slower a web page loads, the more likely your audience and consumers will leave to check out your competitor's website. - Scroll down to continue reading article - - Scroll down to continue reading article - Here is a checklist of how to improve your website speed: Resize your images Reduce image quality Change image format Remove or reduce flashy ads Minimize media embedded from other sources Store media on your own server(s) By using these steps, you're more likely to increase viewership and potentially gain more leads, increasing your business prospects. One of the best steps in doing this is to identify what is causing your website to slow down and take action to remedy it by following these tips. - Scroll down to continue reading article - - Scroll down to continue reading article - Has your Internet and website been slowing down recently? Featured photo credit: Adriana Lee via google.com.ng (Pocket-lint) - OnePlus has recently confirmed it will be unveiling the OnePlus 6 at an event in London on 16 May, and as we edge closer to launch day, we're still learning about the features it will come with. The latest was spotted by tech website Mobigyaan, who found an image posted by OnePlus on its Indian website that confirms the upcoming flagship will have super slow-motion video. The image - which has since had its text replaced - doesn't say what frame rate the OnePlus 6 will be able to record at, but considering the Samsung Galaxy S9 and Sony Xperia XZ Premium can record at 960fps, we'd expect it to be similar. Mobigyaan As for resolution, considering the OnePlus will have the Snapdragon 845 processor onboard, it should be capable of recording 960fps at 1080p, although this has yet to be confirmed. There isn't a lot left to find out about the upcoming "flagship killer", as company CEO Pete Lan recently confirmed it will sport a brand new design by featuring a glass back - which should introduce wireless charging support - and like most other Android flagships, will have a notch in the centre of the display. 5 reasons you should buy the Google Pixel 6a By Pocket-lint International Promotion - 26 July 2022 The Google Pixel 6a is finally here and available to order, so it's the perfect time to look into what makes this phone special. What we don't know for sure is how much the OnePlus 6 will cost when it launches, however a leaked information sheet in China suggests it could cost up to £599 for the top-spec version. Writing by Max Langridge. Bogdan Glisik/Shutterstock We often sit through an episode or movie on Netflix, even though it feels like a drag. Sometimes all it needs is to be sped up. With Netflix's playback speed tool, you can increase the movie or show's pace. Here's how to use it. Visit the Netflix website on your computer, log in to your account, and play a TV show or movie you'd like to watch. Once the video loads and starts playing, move your cursor to reveal the player controls at the bottom of the screen. Hover your cursor over the button that looks like a speedometer in the bottom-right corner. A new "Playback Speed" menu window will appear. Pick one of the five different speed presets to easily increase or decrease your Netflix video's pace. You don't have to tweak any of your Netflix settings to access this feature. It should be available by default, but in case it isn't, Netflix may not be offering it in your country yet. You can also try logging out and back in again. This setting doesn't apply across your Netflix profile and is restricted to the individual viewing session. So if you want to keep the playback speed at a certain pace, you'll have to adjust it every time you play a video. The subtitles will automatically catch up to the new playback speed. Therefore, you don't have to worry about missing out on dialogue if you rely on the on-screen text. Netflix's playback speed tool is also available on your phone. First, ensure that you have the latest version of Netflix on your Android, iPhone, or iPad. Next, launch the Netflix app and play an episode or movie. Tap the "Speed" button at the bottom-left corner to reveal playback speed controls. You can now adjust Netflix's playback speed, either to speed up or slow down the pace. Similarly, you can personalize the look of subtitles on Netflix and even control your playback with just your keyboard. Slow motion video recording is one of the coolest features on the iPhone. Here's how to use it. The camera in the latest iPhones (and especially the iPhone X) is incredibly good. For slow motion video recording, it's actually significantly better than many DSLRs. On the iPhone 8, 8 Plus, and X, you can record 1080p video at either 120 or 240 fps. On the iPhone 7, you get 1080p at 120 fps and 720p at 240 fps. To select which setting you want to use, go to Settings > Camera > Record Slo-mo. Recording Slo-Mo Videos Open your iPhone's camera app and select Slo-Mo from the selector. You can also just swipe right twice. Slo-mo only works with the rear camera, so sadly you can't start planning dramatic slow motion selfie videos. RELATED: How to Free Up Space on an iPhone or iPad Recording slo-mo works like recording any regular video. Just tap the record button and point your phone at the subject to start; when you're done, tap the record button again. One thing to note is that slow motion videos take up a lot of space (in the region of 300MB to 500MB per minute of video). If you're low on storage space, you should make sure not to record in slo-mo for too long. Similarly, you should only really use slo-mo to record things that need it. Editing Slo-Mo Videos By default, when you record a slo-mo video, the start of the video is regular speed, the middle of the video is in slow motion, and the end returns back to regular speed. Sometimes you'll get lucky and the default video will perfectly capture what you want, but most of the time you'll need to edit it. Find the slo-mo video you want to edit in the Photos app and then tap the "Edit" option at the top right. Let's break down the editor interface. At the top you've got the Video Preview (1). Beneath it, you've got the Slow Motion Timeline (2), and the Video Timeline (3). You've also got the Cancel, Play, and Done buttons along the bottom. The Slow Motion Timeline controls which bits of the video are in regular speed and which are in slow motion. The area of the timeline where the tick marks are close together (at the outer edges in the image above) are where it's in regular speed; the widely spaced tick marks indicate slow motion. To adjust which sections of the video are in slow motion, tap and drag on the small handles between the regular and slo-mo areas. Use the video preview to dial things in until you're happy. Quite often, when you record a slo-mo video, you'll end up with areas at the start or end that you don't want. This is where the Video Timeline comes in. Tap and drag at either edge to shorten the clip from the start or end. Again, use the preview to make sure things are as you want them. When you've got the slow motion effect the way you want it, tap the "Done" button, and then the "Save as New Clip" button to save your edited version back to your Camera Roll. The edited version becomes a new video, and does not replace the original. Going Further The iOS Photos app is great for making simple edits, but if you want more control over how slow the slow motion is (or want to have more than one section of the video appear in slow motion), you need to use a third-party app. We love Slow Fast Slow, which is a totally free app, unsupported by ads. The apps developers, Studio Neat also sell physical products and use the app as a promotional tool. With Slow Fast Slow, you use a waveform to adjust the speed of the video. Anywhere the wave is above the center line, the video moves faster than normal. Anywhere it's below that line, the video moves slower. Tap and drag each point to adjust them or long tap on the line to add a new point. If you want a bit more control over your slo-mo videos, Slow Fast Slow is the way to go.
